SUMMARY

Software engineer with 2+ years of experience building Python and Go services, distributed APIs, asynchronous data workflows, and Kubernetes deployments. Strong in system design, reliability, performance tuning, security, and CI/CD, with measured improvements in search latency, service throughput, delivery speed, and test coverage.

EXPERIENCE

Solutions Engineer

Oct 2025 – Present

OpenG2P

Remote

- Architected Python services and REST APIs for high-volume ingestion, validation, change-request workflows, and auditable operations on a national-scale digital public infrastructure platform, tuning PostgreSQL query paths for multi-million-record workloads.
- Built a metadata-driven functional registry platform and a beneficiary financial-address mapping service, spanning asynchronous deduplication, schema-driven staff and beneficiary portals, and an approval workflow service with policy-driven multi-stage approvals.
- Engineered the shared notification layer integration across the registry platform and the approval workflow service, dispatching change-request, intake-form, and export lifecycle alerts with post-commit delivery so a notification can never fail a business transaction.
- Designed production Kubernetes deployment patterns with Docker, Helm, GitLab CI, PostgreSQL, Redis, and service-mesh integration for repeatable multi-environment rollouts across multi-country implementations.
- Load-tested platform APIs over a 10M-record volume tier, lifting sustained throughput from 66.26 requests per second on one pod to 122.26 across three pods with near-zero failures, and tuned indexed search from 219.88 seconds to 1.714 seconds on a 50M-record benchmark.

Software Engineer

June 2024 – Present

Technoforte Software

Bengaluru, IN

- Re-architected monolithic workflows into horizontally scalable Python microservices sustaining enterprise production load on Linux.
- Engineered shared FastAPI authentication, middleware, and standardised API response primitives that accelerated backend delivery by 60% across development teams.
- Modernised legacy modules into Docker and Kubernetes microservices with managed cluster orchestration, lifting automated test coverage from 20% to approximately 86%.
- Cut build and CI/CD runtime by 75% through pipeline orchestration and parameterised Helm workflows.

PROJECTS

Leaderboardgo, Go, gRPC, REST, PostgreSQL, Redis, Prometheus, Grafana

[github](#)

- Built a distributed Go service exposing REST, gRPC, and WebSocket APIs with Redis-backed resilience and Prometheus instrumentation, sustaining roughly 30 microsecond compute latency and 300 nanosecond rank updates.
- Designed sorted-set ranking structures with circuit breakers and stale-cache fallbacks so ranking operations stay reliable under concurrent load.

x940, Rust, PyO3, napi-rs, wasm-bindgen, ISO 20022

[github](#)

- Built a high-speed Rust MT940 bank-statement parser with JSON, CSV, and ISO 20022 camt.053 output plus native Python, Node.js, WebAssembly, and CLI bindings.
- Open-sourced the engine so downstream services integrate bank-statement processing without reimplementing MT940 dialect handling.

AuthService, Python, FastAPI, PostgreSQL, Redis, Celery, Alembic

[github](#)

- Built a FastAPI authentication service exposing REST APIs for secure login, OAuth2 token rotation, JWT issuance, and account-recovery workflows on a layered API, service, and repository architecture.
- Added request tracing, rate limiting, centralised error handling, and asynchronous Celery and Redis jobs with Alembic-managed schema migrations.

EDUCATION

Indian Institute of Technology Goa

B.Tech, Mechanical Engineering

Goa, India

2020 – 2024

SKILLS

Languages: Python, Go, Rust, TypeScript, Node.js, Shell, PostgreSQL

Backend: REST, gRPC, WebSocket, FastAPI, Redis, Celery, SQLAlchemy, OAuth2, JWT, OpenAPI

Platform: Linux, Docker, Kubernetes, Helm, Rancher, GitLab CI, AWS, Prometheus, Grafana

Data and Messaging: Kafka, Keycloak, Novu, JSON-LD, MinIO, Superset
